What is
DBMS?

DBMS

Stands for "Database Management System."
In short, a DBMS is a database program.

In the database management system, a lot of information can be changed at one time (as it can have many users using it at the same time).

DBMS ensures that the data will always be available even after system failures.

Some DBMS examples include MySQL, PostgreSQL, Microsoft Access, SQL Server, FileMaker, Oracle, RDBMS, dBASE, Clipper, and FoxPro.
